FRONT PAGE

Tech is priced for shrinking earnings while Q3 profits grew 53%

After last week's AI-infrastructure flush, @ParadisLabs argued investors are now positioned as if tech companies were reporting negative earnings growth, against actual Q3 tech earnings growth of 53% in aggregate and 35% for the median company, and called it a reasonable spot to start rebuilding longer-term positions. @oguzerkan noted the tech sector's P/E is the lowest since the 2020 Covid crash, blaming fears that the capex-driven boom is cyclical. @aleabitoreddit pushed back on the "AI bubble" label altogether, pointing to memory makers at 1–3x forward earnings and optical names like $POET trading below net cash. X @ParadisLabs · X @oguzerkan · X @aleabitoreddit

Sacks: permitted data centers get built in 2027; he's "really worried about 2028"

On the All-In fallout from Tuesday's midterms, David Sacks said fully permitted projects should still be finished in 2027, but he expects few major new ones after that because no one has a political incentive to grant new permits. Chamath argued a slowdown would make the hyperscalers kingmakers, squeezing neoclouds and model labs that rent capacity. Not everyone agrees: Rosenblatt called the result a "relative non-event" for Nebius, whose big planned US sites are in Missouri, Pennsylvania and South Carolina, not the states that flipped. X @firesidealpha · X @firesidealpha · X @ren_stocks

Apple's own Xcode plugin lands in Claude Code

A plugin authored by Apple now sits in Anthropic's official Claude Code marketplace, letting the agent build, run and test iOS apps, render SwiftUI previews and drive simulators from the terminal. @gregisenberg turned it into a playbook: find high-revenue utility apps rated under 3.5 that haven't shipped an update in six months, then build a better one with agents. X @gregisenberg

Founder of the $400K/month Brainrot app reveals his entire tech stack 🤯

Yoni launched Brainrot in summer 2025. It's a gamified screen time app with a digital pet brain that rots the more you scroll.

It has gone from about $10K/month to about $400K/month, with a couple million downloads.

Here's what it runs on:

> Mixpanel for analytics
> Firebase for analytics and experiments
> Supabase for internal tools and tracking

> Superwall for paywalls
> Appstack for paid ads attribution
> Claude Code and Codex for coding and internal business stuff
> Upwork for finding contractors and freelancers ...

N **Nebulizer** @SMASIMHO · Nov 8

$NBIS recently introduced cached-token pricing for public API @nebiustf customers.

But what is prompt caching?

It is exactly what it sounds like. When you prompt a model, you're sending it context and having it generate an output. This is called running inference.

During inference, the GPU performs calculations and temporarily stores the computations as Key-Value (KV) tensors in a KV cache.
◆ Tensor = Multidimensional array (Data Structure)
◆ Cache = Stored in GPU memory (HBM) ...

> **Nebius** @nebiusai
> Our SVP of Applied AI, Ryan Wang explains the importance of KV Cache management in enabling LLM Inferencing work efficiently at scale. For...

J **Jukan** @jukan05 · Nov 7

1. The counterargument that deliveries can't be pushed back by a year or two just because the two sides worked together from design through validation becomes meaningless once the demand decline is real.

2. Even if they were involved from the design stage, I don't think we have reached the kind of extreme customization seen in foundry, where Micron couldn't do what Samsung was doing. ...

> **Damnang** @damnang2
> I respect Jukan, but I feel a little frustrated whenever I see this kind of argument. You can build any scenario around plausible...

MR **Milk Road AI** @MilkRoadAI · Nov 7

According to Korean media, Samsung and SK Hynix just traded near BOOK VALUE while printing record profits.

Meritz Securities says Samsung's 2027 forward PBR briefly hit 1.13 times and SK Hynix hit 1.00 times during Friday's session.

Foreigners have sold 7.77 TRILLION won of Korean stocks in the first four trading days of November, on top of 18.7 trillion won in October.

SK Hynix just reported about 83 trillion won of operating profit last quarter at an 80% margin while Samsung printed about 107 trillion won of operating profit, a quarterly record. ...

> **Melvin** @MelvinInvests
> Things are getting REALLY ugly across the hedge fund industry. We're now seeing reports of multiple hedge funds facing significant losses...

JL **Jim Liu** @jiahanjimliu · Nov 8

When I come upon great work by a small account where I genuinely learn something new, I give it some light.

@amiratefi_ here gives great color on why grid power will remain scarce and why we will see delays in DC buildouts related to power in 2027.

I believe $IREN is well positioned for scarcity in fully secured power. Scarcity in powered DC is good as it increases chances that silicon will be looking for DCs in 2027 and helps IREN procure and at better prices.

At the same time, limited powered DC capacity prevents overbuild and increases GPU prices.

> **Amir Atefi** @amiratefi_
> Very accurate. This has been the state of play in the data

center industry for about a year now, with points in your follow up comments...

FROM YOUR X

GI **GREG ISENBERG** @gregisenberg · Nov 7

I think the coolest part of having kids is reliving your own childhood in a different way.

You remember what it felt like to be scared of the dark, to wait all year for a birthday or to think a cardboard box was the best toy in the world.

The difference is that now you're on the other side of it. And you get to be the person who makes those moments feel safe and magical.

You see the world through someone who's seeing it for the first time, and it makes you curious again.

I didn't expect parenting to make me feel younger on one hand, and older on the other but some days it does.

Highly recommend :)

x.com/gregisenberg/status/2119213778294435966

THE GOATS

S **Serenity** @aleabitoreddit · Nov 7

I'm going to give a contrarian take on Neoclouds like $NBIS and say the theme looks compelling after the valuation crash.

Since there's a reason why Elon's $SPCX is heavily focused on this market full of "guppies" that would

die:

He sees how attractive the economics are after selling compute to $GOOGL and Anthropic.

And this is reflected by his actions not words, from SpaceX's recent $40B financing for GPUs procurement.
$AMZN, $MSFT, and even $META also see how profitable the economics are and are accelerating their AI DC buildouts.

I'd argue if a Neocloud has:

- Close relationships with $NVDA + others for allocations
- Existing contracted capacity + permitting
- Well funded counterparties, such as Hyperscalers.
- Attractive economics, such as financing their procurement correctly (not the way $CRWV has with high debt interest unless they refinance).

Then I think they'll do just fine...

However, the bigger worry is more toward newer players starting financing or the permitting process, since barrier to entry has now become extremely high.

For financing, read through on $IREN earnings has shown public Neoclouds can adapt extremely well to tight markets:

As seen with their 90% prepayments for GPU capex on a 5Y deal.

Their older H100 GPUs recontracted at double their previous pricing and 12% higher contracted pricing also point against depreciation fears.

And in the case DC buildouts slow from permitting delays... it heavily favors some over others.

Rosenblatt's recent note for example stated they see little risk with $NBIS primary buildout that was in Missouri, Pennsylvania, and South Carolina.

And there's probably less risk with developers in places like Australia.

Markets have also show this infinite compute arbitrage can't go on forever, hence the reluctance to further finance capex, via things like ATMs.

But ironically, tighter financing and hypothetical restrictive permitting would increase the competitive advantage of established neoclouds.

And create a larger moat against newer DC developers.

INVESTMENTS

MACRO & FLOWS

TK **The Kobeissi Letter** @KobeissiLetter · Nov 7

CapEx in the US is skyrocketing:

The value of US nondefense capital goods shipments, excluding aircraft, jumped +11.6% YoY in September, reaching a record $86 billion.

This marks the fastest annual growth rate since July 2021.

Even more impressive, shipments have risen at a 3-month annualized rate of +16.5%, the strongest pace since 2011, excluding the pandemic recovery.

Since October 2024, shipments have increased by +$12 billion, or +16.5%.

Much of this momentum is being fueled by the AI investment boom.

Orders for computers, servers, storage devices, and related equipment have surged +27% YoY, the largest annual increase since January 1997.

The AI infrastructure buildout is beyond massive.

NEOCLOUDS

JL **Jim Liu** @jiahanjimliu · Nov 7

$IREN's Advantage in the Neocloud Race

There's more to IREN popped 20% on Friday than the 228m revenue and announced 22m/MW long term deals and 40m/MW short term deals. If you study the after hour price action, you'd see IREN stock lost considerable gains on the announcement of H2 delays even though it was MSFT's change request but regained the loss on the announcement of their FY 2027 funding strategy.

Datacenter Backed Financing

$IREN currently has 9B in "cash, undrawn GPU financing facilities, and contracted customer prepayments" (1). $IREN needs $15B capex for FY 2027 so astute investors might be questioning where they will get the remaining 6B.

On the earnings call IREN has stated they have 6B of unencumbered billing datacenters and will have 10B once H2-4 and rest of Mackenzie and B300s in Childress (2 - picture 1). Of their 15B of GPUs, 6B are unencumbered as GPUs bought with previous convertibles and ATMs.

Datacenter Assets > GPU Assets in Stability

The Datacenter assets are stronger for financing than the GPUs. To show the appetite for DC assets, on Nov 3, DCRU sold 3 North American Datacenters to DLR at 5.2-6.6% cap rates or 21m-26m/MW (3). DLR is essentially a datacenter REIT and they are buying datacenters that were built pre-2000. 5.2-6.6 cap rates are incredible for pre-2000 DCs and clearly shows for safe assets like DCs!

In historical of overcapacity in silicon chips, silicon chips without datacenters are massive negative cashflows, even at negative profit, all extra silicon needs datacenters to make the negative profit manageable. So all this Elon scare of financing drying up for GPUs backed financing, does not hold for DCs backed financing.

Own the Assets = Flexibility to Adapt

IREN has also stated that they are only using ATM opportunistically and that they have also slowed down their Capex spend on developing the further out sites in their pipeline and have the flexibility to stop their ATM (1).

Asset Heavy is Not So Expensive

Once you understand that capex used for the initial generation of DCs once billing can be used to financing future DC buildouts, you understand the flywheel. Then IREN basically gets save on both colocation and potential BE fuel cell costs in their final margins!

$CRWV does not have DC assets and $NBIS only has Finland which is small relative to their market cap. $IREN will have 10B of DCs relative to their 10B market cap! At 50%-70% LTC, this means IREN can access half their funds equal to more than half market cap without diluting! In times like this, wall street absolutely loves that and it's a big part of $IREN's 20% move on Friday.

Once shorts realize they cannot rely on ATM shares to cover their short positions, IREN will an ignited recovery.

Everything Is Relative

At less than 1/3 the market cap, $IREN has much less growth expectations than $CRWV, $NBIS which also means it needs to expand less which means it needs less Capex and $IREN is in the unique position that it's DC asset base is equal to it's market cap and if you count it's 6B of unencumbered DCs, $IREN has access to 12-15B of financing.

*Fiscal Year (FY) 2027 Refers to July 2026-June 2027.

EVERGREEN

THREAD · OCT 27

The AI industry is making an unusual bet: buy compute for years, sell intelligence by the token

sridhar @RamaswmySridhar

A 16-part thread that borrows from five older industries to map AI's risks: banks (funding contagion), commodity merchants (spread risk), airlines (utilization), utilities (offtake finance) and cloud providers (pooling). His conclusion: watch paid GPU use, price per unit and firm obligations, because a capacity bust is more likely than a bank run.

x.com/RamaswmySridhar/status/2115159261533929911

POST · NOV 2

"It's liquidity that moves markets"

Larry Tentarelli @bluechipdaily

Tentarelli revisits Stanley Druckenmiller's 2015 line that central banks and liquidity, not earnings, drive the overall market, and ties it to Livermore, Weinstein and O'Neil on rotation. His point: sector and macro cycles can overwhelm great single-stock fundamentals, which is how AI names rolled over while the numbers still looked strong.

x.com/bluechipdaily/status/2117301413315289095

POST · OCT 21

Does anyone on here post theses on companies anymore?

Gaetano @Gaetano2026

A plea for real investing ideas over grand predictions and reactions to minute candles. If you're bearish, show how you're positioned; if you're bullish, show the thesis. He argues how a view is expressed in an actual portfolio is worth 100x more than calling everyone else stupid.

FOUR CARDS

If a parcel is marked Express, it has a red sticker.

Red sticker	No sticker	Express	Standard

Each card has one thing on each side. Which cards must you turn over to check the rule?

RIDDLE

If you have me, you want to share me. If you share me, you haven't got me. What am I?

End of today's paper.

Covering roughly Nov 7–8, 2026. Compiled Sunday morning, ET. Links are in the web edition.

ANSWERS

MENTAL MATH

1. **180** 20 × 9 = 20 × 9 + 0 × 9 = 180
2. **36** 10% is 24, so 15% = 1 × 24 + half of 24 = 36
3. **about 44,000 litres** 1.5 × 365 × 80 = 43,800

FOUR CARDS

Turn Express and No sticker. Express could hide something that breaks the rule; No sticker breaks it if the other side turns out to be Express. Red sticker can't break it (the rule never says only those cards have it), and Standard isn't covered by the rule at all. Most people pick the card that matches the rule's second half instead of the one that could falsify it.

MINI CROSSWORD
