FRONT PAGE

The AI trade splits: hyperscalers rally while neoclouds sell off

On Wednesday, Amazon and Microsoft each jumped about 7% and Google about 4%, while CoreWeave fell nearly 10%, IREN about 11%, and Nebius about 6–7%. Commentators on X read the move as a bet that data-center pushback and local delays will hit pure-play neoclouds harder than the big cloud platforms, consolidating the market toward the hyperscalers. Separately, Oguz Erkan argued semiconductor valuations have already peaked relative to margins, with the easy money in chips largely made and demand expected to ease after 2027. X @oguzerkan · X @MilkRoadAI · X @oguzerkan

OpenAI @OpenAI · Nov 4

Our security researchers built an autonomous cyber vulnerability discovery, exploitation, and patching pipeline.

In a single run with an upcoming cyber model, it validated and generated patches for 948 local privilege escalation vulnerabilities in the Linux kernel at a total API cost of $1.2 million.

x.com/OpenAI/status/2118119451401048497

Starlink Mobile: a nationwide satellite-plus-terrestrial phone network, with Qualcomm chips from 2027

Starlink said it is building the first fully integrated U.S. nationwide satellite and terrestrial network meant to keep phones connected everywhere, with 5G base stations using Qualcomm chips to accelerate deployment starting in 2027. On an earnings call, Qualcomm CEO Cristiano Amon said Starlink-related revenue should start to appear as Qualcomm exits fiscal 2027 and is mainly a fiscal 2028 story. X @Starlink · X @firesidealpha

Micron scraps a planned Taiwan fab; less memory supply for 2028

Jukan reported that Micron scrapped plans for another Taiwan fab that was supposed to come online in 2028, after the local union pushed for higher bonuses — implying less supply hitting the market that year. Paradis noted Micron's Taiwan bonuses were about 4–5% of operating income versus roughly 10% at SK Hynix and Samsung, calling the gap ludicrous given Micron's recent operating income. Former $AMZN employee on why existing workloads are the strongest advantage in the hyperscalers'AI race and that $AMZN earns a higher margin on open-source tokens than Claude tokens:

1. The expert emphasizes that $AMZN started out behind in AI, seen as an infrastructure provider and caught off guard by OpenAI and $MSFT. Without a competitive model, it competed on compliance, reliability, scalability, and GPU availability until it added $ANT's models, which let it compete on model quality too. ...

DVB @DeepValueBagger · Nov 4

The main reason people round trip is that people don't want to admit that they made a mistake and acknowledge there are other ways to make money.

I have 3 favorite ways to do it.

> If you pick up leaps in low vol, a 20% stock movement give you 100% return.

> Going into cash stops the bleed and use it to earn 10% every 2 weeks on stocks that have reached their 52 week low while earning 10% and put that toward building a new position. This is perfect for expected consolidation period for months.

> Consolidate positions, and move it to winners.

> **DVB** @DeepValueBagger

Serenity @aleabitoreddit · Nov 4

Little rant, but to show you how rampant deleveraging has become:

- $CIFR is worth 44% LESS than when they announced their initial $GOOGL / $AMZN colo deals.

- $AAOI is now ~ the same price BEFORE they secured major hyperscaler orders, raised $1.6B for capacity expansion and gave their suprising initial -> $378M+ projection -> ~$471M revenue forecast.

- $ESMT ($2B MC) is the perfect example representing the memory sector.

B-BUT AI NAMES ARE NOT PROFITABLE??? Q3 Earnings: $526.2M gross profit, $330M net income. ...

> **Noobverest Rice King** @Noobverest
> @monymonykay @aleabitoreddit Yes its a joke Moving things from things that make money into things that make no money is the current trend

The Humanoid Hub @TheHumanoidHub · Nov 4

One of the biggest data bottlenecks in robotics is turning raw human video into high-quality training labels.

Perceptron Egocentric 1.0 is a self-service API that turns first-person human and robot video into structured training data:

- Timestamped subtask timelines, down to sub-second actions
- A separate activity timeline for each hand (or gripper)
- State-of-the-art 3D hand reconstruction, no camera calibration needed

It claims to match GPT-6 Astra on subtask quality at ~1/8 the cost ($9 vs ~$76 per video-hour), full stack at $29. ...

Daniel @danielisdizzy · Nov 4

My predictions:

• $AMZN becomes a $10T company by 2030.
• $ORCL becomes a $1T+ company within the next 3 years.
• $META smart glasses replace the iPhone.
• $CBRS becomes the go-to solution for fast inference across every major AI cloud.
• $GRAB becomes the operating system of Southeast Asia.
• $LMND becomes the largest insurance company in the world.

FROM YOUR X

Andrej Karpathy @karpathy · Nov 1

Weekend hack: HackerTube. I was annoyed with YouTube's recommendations so I had Claude filter down 43M comments over 20 years of HN to 6,454 videos that keep being recommended. *Significantly* better viewing experience, ~2 hours with Opus 5.5: https://t.co/JIhXN7OSh1

- Excellent recs without any logins (state is kept in local browser session)
- Thumbnail is a representative frame from middle of the video instead of the super duper A/B test hyper-optimized user uploads
- Underlying data from the comment analysis as one zip file, point your Claude at it and ask for your own version
- HackerTube Longs ✊

A bit more on the process:
I use Claude Code (desktop app for Mac), Opus 5.5 on Medium effort as my default. I only talk to Claude and have it do everything, the only "manual work" I helped with in tandem was in the browser (reminiscent of MenuGen): 1) I had to create some kind of API key from Google Cloud UI to query YouTube for video metadata, 2) I booted up a VPS box for serving and 3) I bought the domain name. Once the box was up I gave Claude the IP and told it update, secure, harden, deploy and optimize the code, and it did the whole thing.

Many awesome projects that would have normally taken weeks/months even can now be few-shotted for breakfast. What else are we not thinking of.

cat @_catwu · Nov 5

Some news: I'm joining OpenAI to lead product management for Core Products!

I have a lot of respect for OpenAI for showing the world that scaling works, for bringing AI to over a billion people, and for believing great products are core to the mission.

I'm excited to work with @thsottiaux, an incredible PM team, and everyone across OpenAI. Together, we'll build agents that have your back and your team's, and keep you in control, so you get more time for the people and work you love.

Lots to learn, and lots to build. Please keep your feedback coming!

x.com/_catwu/status/2118137612577968402

Charlie Holtz @charlieholtz · Nov 4

I am very excited to share that Conductor is joining Meta!

We have some big, crazy plans for the next interface. If you liked Conductor, you're gonna love what's coming.

We're super excited to work with @natfriedman and @alexandr_wang at MSL to build it. They've been on an absolute tear, and I'm convinced MSL has the highest talent density of all the labs.

A huge thank you to our earliest believers @aaron_epstein, @ilyasu, and @nabeel. And to everyone here who tried Conductor, sent us feedback, and prompt requests - you made this so much fun. Thank you ❤️🚂

Choo choo!

> Background subagents in Claude Code now use less of your usage limit.
>
> A running subagent updates its status line every 30 seconds, and each update used to re-read its whole conversation. Now Haiku 5.5 writes it from short notes instead, so each update costs about 99% less. https://t.co/u4maCuWq6A
>
> x.com/ClaudeDevs/status/2118063143167693011

> **GREG ISENBERG** @gregisenberg · Nov 3
>
> running a company nowadays feels kinda dystopian
>
> my team is 50+ people in 12 countries, but i talk to my agents more than my human teammates
>
> - voice note to grokbot
> - mattpocock/skills /grill-me so the agent interrogates the idea before anything gets built
> - spec drops into linear through the linear mcp
> - exa + firecrawl agent reads every competitor site, pricing page and changelog
> - https://t.co/a5ARFnvSnA to find ideas and trends
> - apify pulls g2, reddit and app store reviews
> - prompt: "find the 10 complaints that show up most and quote the users"
> - context7 so the agent reads the latest docs before it touches any api
>
> the design
>
> - claude code + paper mcp
> - 4 versions of every screen before a single line of code
> - pick pieces from 2, it merges them. diverge then converge
> - frontend-design skill from anthropic/skills + our own design system skill
> - cleanshot screenshots of any ui i like go straight in with "make it feel like this"
>
> the build
>
> - pingdotgg/t3code as the control surface for every agent, from my phone too
> - stablyai/orca runs a fleet of agents in parallel, each in its own git worktree
> - graphify maps the whole codebase into a knowledge graph so agents navigate instead of guess
> - headroom compresses tool outputs before they hit the model, so tokens go 20-95% further
> - lsp plugins so the agent sees types and errors like an ide does
> - security guidance hook flags risky edits before they land
> - supabase mcp for the database, stripe for billing
> - github mcp opens the pr, vercel spins up a preview
> - loops run overnight, i check what shipped over coffee
>
> the user testing
>
> - lightpanda as the headless browser, way lighter than chromium so you can run hundreds at once
> - agents click every flow on the preview like a first-time user
> - one persona is impatient, one is confused, one is on a phone
> - playwright + chrome devtools mcp for regression tests
>
> the bugs
>
> - sentry mcp catches the error
> - agent reads the stack trace and opens a fix pr in under 10 minutes
> - human just approves
>
> the data
>
> - posthog mcp cron at 7am on yesterday's funnel
> - any step that drops more than 10%, the agent watches 20 session replays and tells me why
> - stripe mcp pulls every cancellation reason into one doc every monday
>
> the agents' tools
>
> - orgo so every agent gets its own computer
> - agentmail so every agent gets its own inbox
> - agentphone so i can call them from the car
> - composio connect-apps for every other connector
> - akitaonrails/ai-memory, a git-backed markdown wiki so they remember what we decided last week
>
> the skills
>
> - wshobson/agents so skills work across claude code, codex and opencode
> - my writing voice
> - our design system
> - how we write specs

- skill creator so the agents write new skills themselves

some helpful tricks

- one agent per platform. the x agent never touches email
- cheap model for triage, opus for anything that ships
- every output gets scored 1-10 by an llm judge. under 8 goes back
- every agent writes a 5-line log at night so i can read the whole company in 2 minutes
- every agent mistake becomes a new skill, so it only happens once

the team

- humans get version 5, not my voice note which they are happy about lol
- their job is creative feedback, relationships and telling the agents what they got wrong

a human pm reviews the funnel once a week. this reviews it every morning

running a company is now voice notes and inference

x.com/ParadisLabs/status/2117406414008152088

S **Serenity** @aleabitoreddit · Nov 2

We've finally made it to November... holy crap October was brutal.

Per Morgan Stanley data, the recent hedge fund de-grossing was the highest in the past 10 years.

Exceeding the:
- 2016 Chinese stock market crash
- 2018 Volmageddon
- March 2020 COVID crash
- 2021 Archegos collapse / Evergrande crisis
- 2022 bear market

Goldman's prime brokerage desk reported on the 26th that it had also seen ~$20B of selling over 2 weeks vs. $23 billion during July's entire unwind.

From $HOOD short interest data, from Sept -> Oct short float also increased from:

$AAOI: 12.5% -> 19.84%+
$AEVA: 11% -> 25.64%+
$CBRS: 12.25% -> 20.12%+
$AEHR: 14.33% -> 17.93%+
$TSEM: 2.15% -> 4.73%+
$CIFR: 19.94% -> 25.39%+
$LWLG: 15.24% ->19.12%+
$OKLO: 17.72% ->22.93%+
$CRWV: 17.91% ->26.58%+

Substantial deleveraging coinciding with surging short interest, kinda looks like a July setup after Midterms?

The recent rotation also kinda pushed names like $CRWD and cybersecurity to bubble valuations into hundreds of fwd P/E...

Earnings on many AI capex + bottlenecks (not all like $INTC) looked strong:

eg. $AXTI guided annualized Q4 = 23.7x P/E now, not including potential InP substrate hikes + capacity expansion that can compress it to single digits.

- $SKHY (~$59B operating profit) casually making more than trillion dollar companies like Amazon ($28.1B operating profit), backed with 5Y LTAs.

- No signs of $MSFT / $AMZN materially cutting capex, while $SPCX secures $40B more for GPU procurement.

Slightly painful, but I think the AI capex trade (specifically photonics/memory) is a generational opportunity, with extreme volatility in between.

PM **Paul Millerd** @p_millerd · Nov 3

2027 Is going to be an absolutely wild year for knowledge work

I actually think there will be far more opportunity in terms of jobs, but you are going to have to work with agentic coding models. It's still early so a lot of stuff isn't abstracted away

I have had a surprising amount of people reach out to me in the last 2 months, wanting to just talk with somebody who's gone through letting go of a fancy work identity

The good news is that many people get to a spot where they feel happier about work. Does that mean a guaranteed path to always making money in a very stable and secure way? No. But it does mean there are far more ways to work in today's world and be satisfied with that

I think the key is to not trade your present for the future. Fear and worry. And the sense that you are "behind," are always stealing your present. And the present is the only way you can actually channel curiosity or creativity - the best way to embrace an emergent path

x.com/p_millerd/status/2117553790463479941

INVESTMENTS

NEOCLOUDS

DK **Daniel Koss** @daniel_koss · Nov 5

Short $NBIS, long $ORCL.

This Citrini trade seems absolutely INSANE to me.

The exact OPPOSITE trade seems much smarter.

1) COUNTERPARTY RISK: Oracle's largest customer is OpenAI (~$300B deal). Oracle is BBB-, one notch above junk, with ~$118B of long-term debt. Nebius's backlog sits on investment-grade Microsoft and Meta contracts and is financed against them.

2) Execution risk: Oracle had reported OpenAI site delays and a slower Abilene ramp. Nebius delivered every Microsoft and Meta tranche on time.

3) Regulatory risk: Oracle's Stargate footprint is heavily in TEXAS, the exact moratorium risk Citrini warns about. Nebius has ZERO disclosed Texas sites.

4) Geographic flexibility: Nebius builds across Europe, the Middle East (Israel, NEOM) and is expanding into APAC.

No matter which angle you look from, this pair is the exact opposite of what you'd do for every reason Citrini seems to fear. Just makes no sense 🤷

> **Liquid** @liquidtrading
> JUST IN: Citrini Research publishes research note advising clients to take a short position in $NBIS

SEMIS CYCLE

OE **Oguz Erkan** @oguzerkan · Nov 5

We are likely near the peak of the AI cycle.

Historically, semiconductor valuations peak just before margins peak, which indicates a turning point in the cycle.

Forward multiples have been contracting this year while margins have kept expanding. Given that multiples roll over before margins, we'll likely see peak margins next year.

This means demand is expected to ease post-2027.

So, the easy money in semiconductors has already been made. There could still be some upside to $NVDA and $AMD, depending on how fast demand cools post-2027, but nobody should expect the violent upward moves we saw in the last 2–3 years.

> **Evan** @StockMKTNewz
> Citrini Research said today it now thinks we have passed the peak in AI Infrastructure CAPEX cycle

x.com/oguzerkan/status/2118286053777785066

OPTICAL

Coherent signs another ~$20 billion PhotonLink LTA with a major AI company

On its Q1 call, Coherent said it signed another significant PhotonLink long-term agreement with a major AI company, with total revenue value of about $20 billion over five years. Gaetano flagged that almost every recently signed TLA includes upfront customer funding — prepayments or development payments — so customers have skin in the game on the capacity being built. Liquid software: an improvements box that an agent just implements

Patrick Collison @patrickc

Collison is wiring a freeform "improvements" input into his personal apps so an agent will yolo-implement whatever users submit. Activation energy collapses; one user shipped 150 improvements in a few days. He calls the pattern liquid software — and says every app without it now feels slightly rigid.

Update the best argument against your own position

Chris Camillo @ChrisCamillo

Camillo's discipline: constantly update the strongest case against your thesis, not to dismiss it. For Amazon, he walks through the agentic-commerce threat from Meta Muse and other agents that could own discovery — then explains why he still holds, with an updated conviction level rather than a slogan.

Capital markets as a live experiment in narrow superintelligence

GestaltU @GestaltU

GestaltU argues we've already run a large-scale experiment in unleashing a superintelligence on a narrow objective: U.S. capital markets — millions of agents wired through prices, chasing risk-adjusted return. Spectacular at its job; also a cautionary tale about objective functions and side effects.

THE PASSAGE

SCRIPTURE

Hast thou not known? hast thou not heard, that the everlasting God, the LORD, the Creator of the ends of the earth, fainteth not, neither is weary? there is no searching of his understanding. He giveth power to the faint; and to them that have no might he increaseth strength. Even the youths shall faint and be weary, and the young men shall utterly fall: But they that wait upon the LORD shall renew their strength; they shall mount up with wings as eagles; they shall run, and not be weary; and they shall walk, and not faint.

— The Bible, *Isaiah 40:28–31* (KJV)

GAMES

MENTAL MATH

1. 24 × 4 = ?
2. 45% of 760 = ?
3. Fermi: a resting heart beats about 70 times a minute. Roughly how many beats in a year?

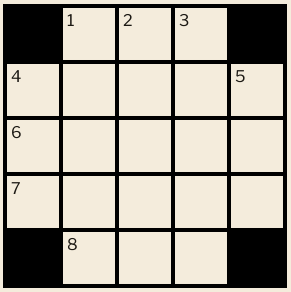

FOUR CARDS

If a card has a vowel on one side, it has an even number on the other.

R	2	9	A

Each card has one thing on each side. Which cards must you turn over to check the rule?

MINI CROSSWORD

Across

1 The atmosphere and outer space as viewed from the earth (3)

4 A cloth having a crisscross design (5)

6 Of the highest quality (5)

7 Express or state indirectly (5)

8 A number of sheets of paper fastened together along one edge (3)

Down

1 A noticeable deterioration in performance or quality (5)

2 The 10th letter of the Greek alphabet (5)

3 Production of a certain amount (5)

4 A unit of pressure (3)

5 A reformer who opposes the use of intoxicating beverages (3)

RIDDLE

What gets wetter the more it dries?

End of today's paper.

Covering roughly Nov 2–5, 2026. Compiled Thursday, ET.

Want more or less of something tomorrow? Tell us in "Tune tomorrow's paper" at the end of the web edition.

ANSWERS

MENTAL MATH

1. **96** 24 × 4 = 20 × 4 + 4 × 4 = 96
2. **342** 10% is 76, so 45% = 4 × 76 + half of 76 = 342
3. **about 37 million** 70 × 60 × 24 × 365 = 36,792,000

MINI CROSSWORD

■	1 S	2 K	3 Y	■
4 P	L	A	I	5 D
6 S	U	P	E	R
7 I	M	P	L	Y
■	8 P	A	D	■

FOUR CARDS

Turn A and 9. A could hide something that breaks the rule; 9 breaks it if the other side turns out to be A. 2 can't break it (the rule never says only those cards have it), and R isn't covered by the rule at all. Most people pick the card that matches the rule's second half instead of the one that could falsify it.

RIDDLE

A towel.
